# Promise in JavaScript

#### @Aakash Kanojiya

#### What is Promise?

The **Promise** is an object in JavaScript that is use for asynchronous programming.

It has different states that are:

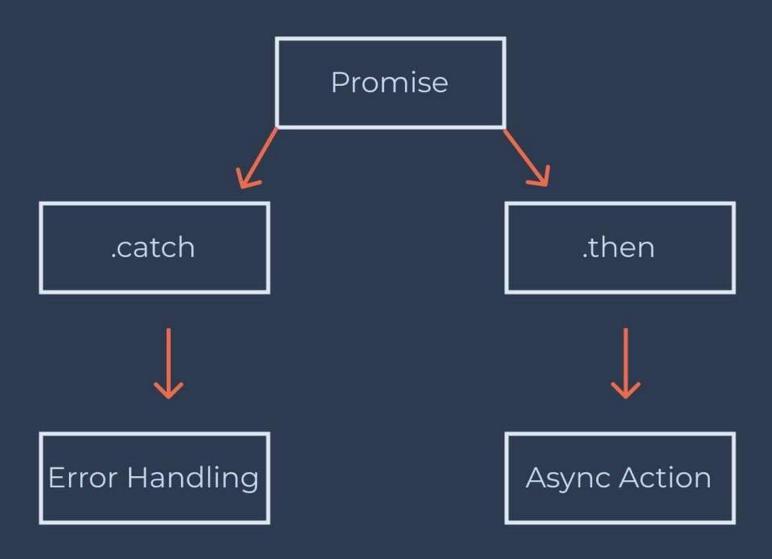

Fulfilled - A promise has been completed

Rejected - A promise has been failed

#### Demonstration

Here's a demonstration of how promise work:

### An Example

Here's an example of a Promise:

```
Makes the function an asynchronous

const myPromise = new Promise((resolve, reject) => {
    setTimeout(() => {
        resolve("foo");
        }, 300);
    });

Calls this function when

JavaScript native the timer is completed

Function
```

## A Simple Example

Here's another example of a Promise:

```
const myPromise = new Promise((resolve, reject) => {
   if(/* condition */){
      resolve();
   } else {
      reject();
   }
});

myPromise.then(res => {
      /* handle Resolve */
}).catch({
      /* handle Reject */
})
```

## Promise vs Async Await

Promise vs Async Await is a whole topic itself but one of the major difference is Promise use nested functions (.then) which eventually makes too many nested functions and code looks like a mess.

On the other hand Async Await keeps the code look more synchronous and clean.

At the end, both helps you achieving the same task.
